## Policy No. 1.8.39

### Thromboprophylaxis

<b>Policy Type (Organisational or Departmental)</b>	Clinical Procedure
<b>Ratified by Governance Committee</b>	Continuum of Care
<b>Effective Date/Date Ratified</b>	1/12/2007
<b>Review Date(s)</b>	1/12/2010
<b>Policy Statement (Objective/Ratio nale)</b>	Thromboprophylaxis is required in unstable, previously ambulatory patients admitted with an acute change in their condition for the prevention of venous thromboembolism, (VTE) which can have a significant effect on morbidity and mortality.
<b>Definition</b>	Primary prophylaxis: The prevention of VTE and its complications through the use of medications or physical preventative measures. Risk factors include: age> 60 years, malignancy, prolonged immobility, sepsis, pathological fracture and spinal cord injury. Secondary prophylaxis: Long term anticoagulation in those patients who have previously had a VTE
<b>Key Performance Indicators (Outcomes)</b>	Minimisation of thrombotic events in appropriate patient group. Compliance with policy.
<b>Policy</b>	<p>Thromboprophylaxis should be considered in previously ambulatory patients, admitted to the inpatient facility with acute change in their condition and mobility. This may include infection, hypercalcemia, recent spinal cord compression, post operative or recent functional decline with restorative care as the goal.</p> <p>Need to take account of the patient's prognosis and the potential effect on quality of life to avoid inappropriate treatment.</p> <p><b>Inappropriate patients :</b></p> <ul style="list-style-type: none"> <li>• Terminal phase</li> <li>• Allergy to LMWH</li> <li>• Thrombocytopenia &lt;70,000</li> <li>• Active bleeding including GI</li> <li>• Recent large cerebral infarct or cerebral haemorrhage</li> <li>• Severe hepatic failure</li> <li>• Cerebral metastasis</li> <li>• Frequent falls or high falls risk</li> <li>• Severe uncontrolled hypertension &gt;200/120</li> <li>• HITS (Heparin induced thrombocytopenia)</li> <li>• Spinal or epidural catheterizations</li> <li>• Bacterial endocarditis</li> </ul> <p><b>Medication</b></p> <ul style="list-style-type: none"> <li>➤ Patients already stabilised on Warfarin are to remain on their current regime (Warfarin policy)</li> <li>➤ Low Molecular Weight Heparin is recommended for primary prophylaxis</li> </ul>
